Title: Internal Microservice Catalog and Health Portal

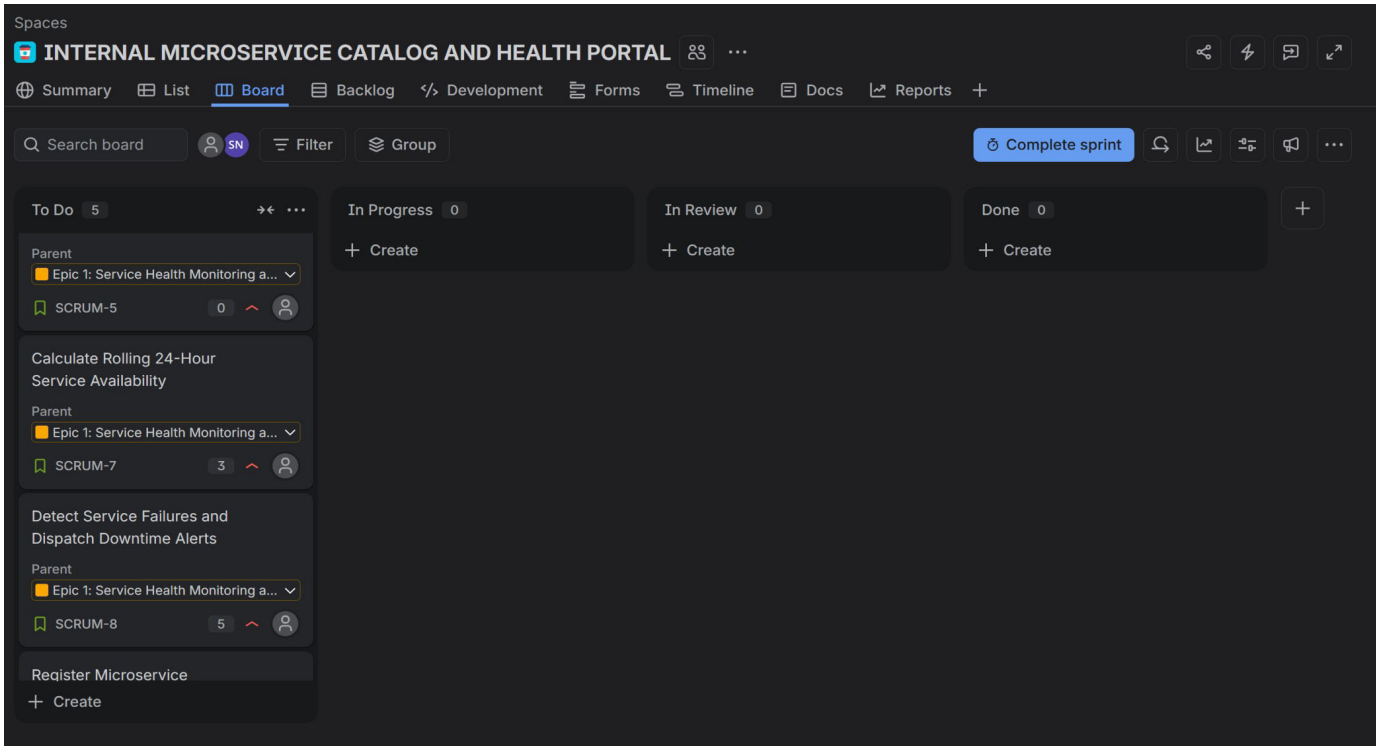

Jira backlog with epics and user stories and story point assignments:

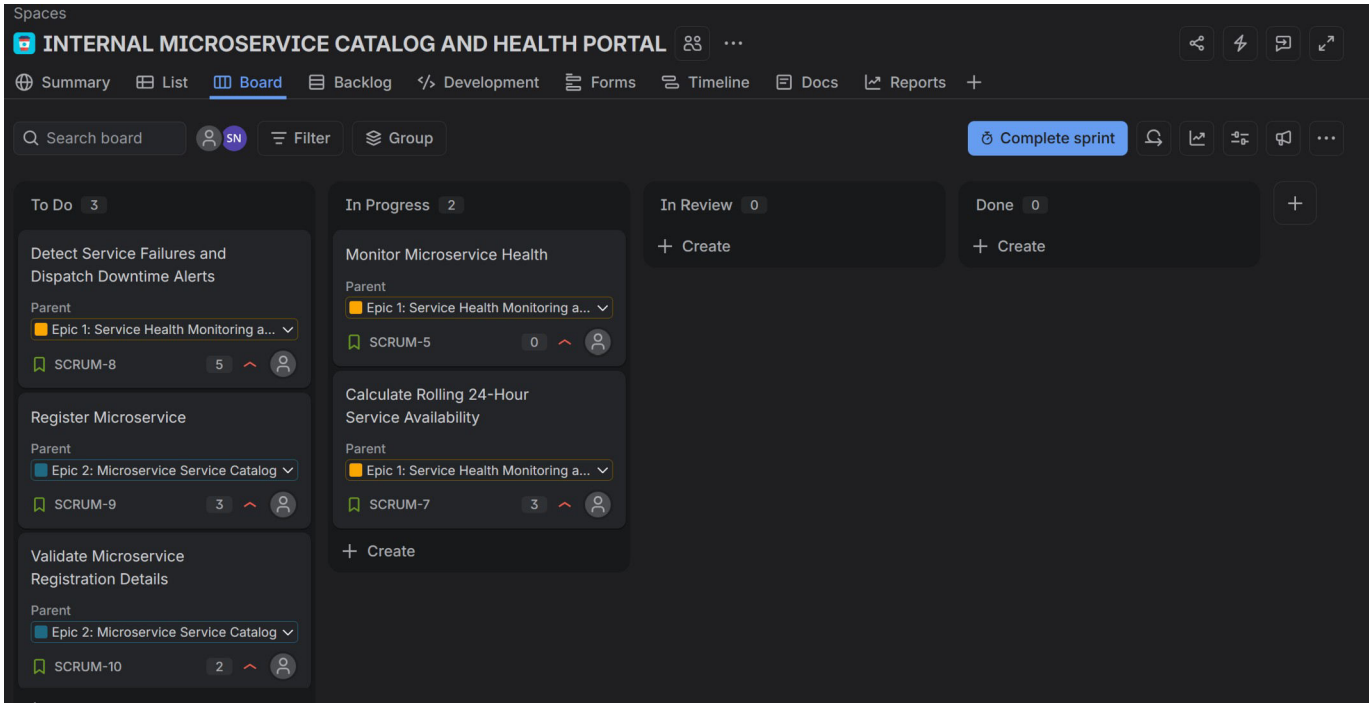

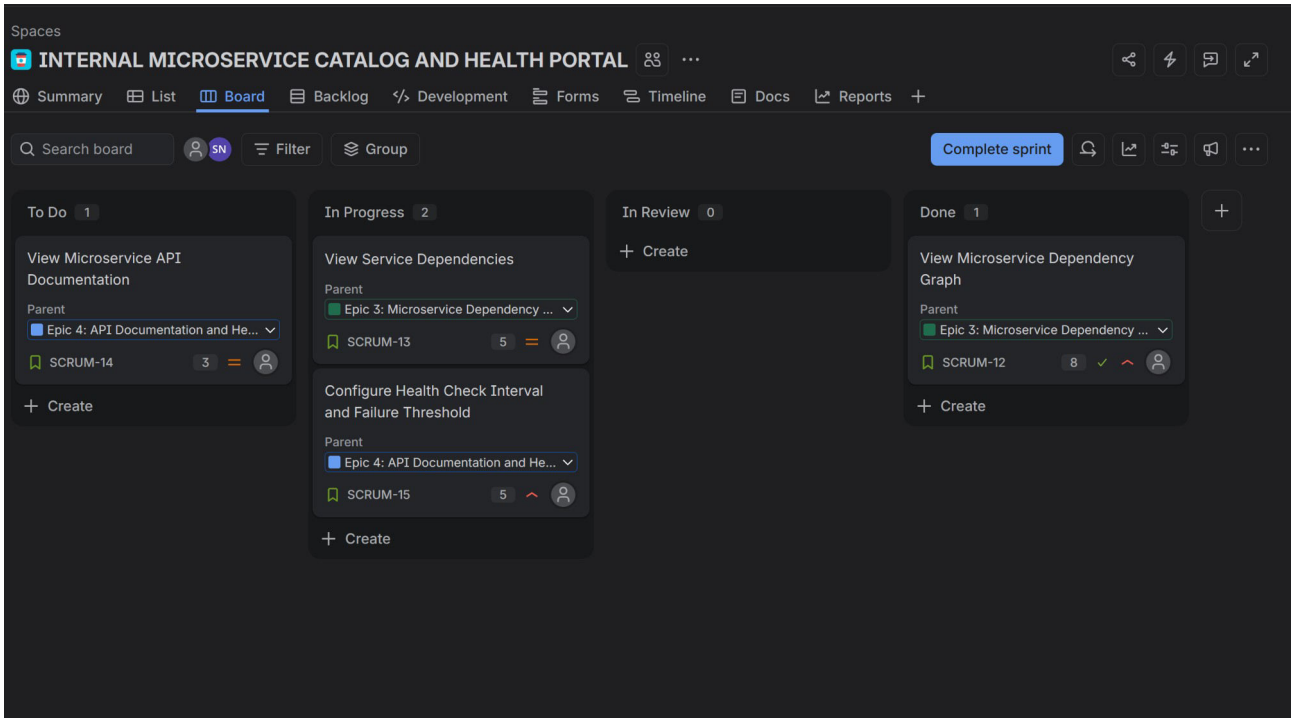

Active sprints-

Sprint 1:

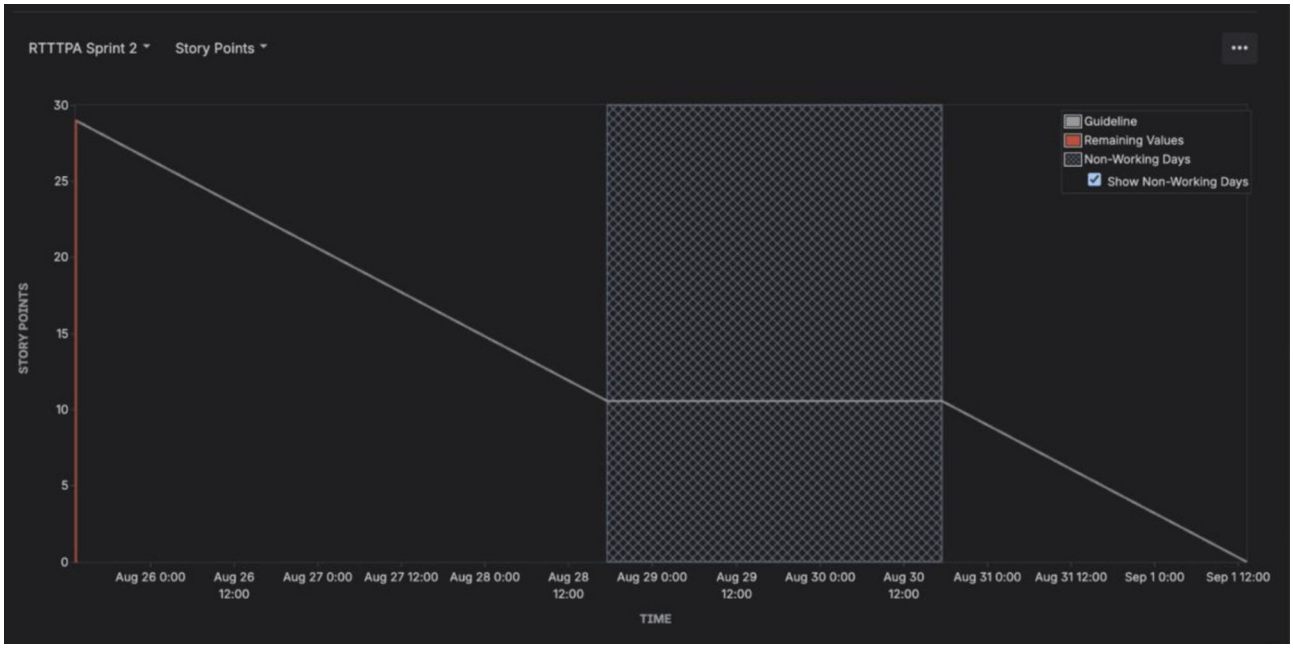

Sprint 2:

Burnout chart:

Reflection Questions-

1. Did your estimations reflect the actual effort?

Yes, the story point estimates reasonably reflected the effort and complexity of the User Stories. Smaller and less complex tasks were assigned fewer points, while more complex tasks involving monitoring, failure detection, and configuration were assigned higher points. Overall, the estimates provided a reasonable representation of the relative effort required.

2. Was your backlog well-prioritized?

Yes, the backlog was prioritized based on the importance and business value of the features. Core functionalities such as monitoring microservice health, detecting service failures, and registering microservices were given higher priority, while supporting features such as dependency visualization and API documentation were given comparatively lower priority.

3. How did your simulated sprint align with your plan?

The simulated sprint generally aligned with the planned backlog. The selected User Stories were added to the sprint, assigned Story Points, and progressed through To Do, In Progress, Done. This helped simulate how the planned work would be completed during a real Scrum Sprint. The guide specifically instructs this progression for the Sprint simulation.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed how the remaining story points decreased as the user stories were completed. It provided an indication of the team's progress and capacity to complete the planned work within the sprint. It also helped compare the actual progress with the ideal burn rate and showed whether the team was progressing toward completing the committed work.
